1 List of Features

- People detection up to 9.4 meters
  - Measures distance from sensor to person
  - Presence detection of people with no other movement than respiration
- Obstacle detection up to 9.4 meters
  - Reports distance to first static target
- Radar sensor
  - Baseband data output
  - Pulse-Doppler output
- Novelda Ultra Wide Band (UWB) Impulse Radar X4 system on a chip (SoC)
- Built-in TX and RX antennas
- Multiple interface options
  - Serial interface, UART and USRT
  - On-board USB interface
- On-board multi-color LED
- Certifications
  - FCC (pending) for USA
  - CE for Europe
  - IC for Canada
  - KCC (pending) for Korea
  - MIC (pending) for Japan

Whenever this datasheet states X4M300 the description is valid for all the above order codes unless explicitly stated otherwise.

2 XeThru X4M300 Presence Sensor

The X4M300 Presence Sensor contains a profile that can detect and monitor people's movement and presence within the detection zone. The sensor module is ready for product integration.

X4M300 senses human presence by detecting all major and minor motions in a room such as a person walking and hand movements. Its extreme sensitivity enables it to detect presence up to a distance of 9.4 meters with great accuracy. It is also able to measure the distance between the device and the user, and is not susceptible to "dead spots" within the detection zone.

The X4M300 has the ability to see presence of a person with no other movements than his respiration motion. This unique ability enables implementation of products that does not lose track of a person's presence if he/she sits still for a longer time period. With the XeThru technology's ability to see through light materials it also enables products that detect a person's presence while sleeping in a bed with a blanket, duvet or clothes covering the person's body.

2.1 Supported Profiles

A Profile is defined as a specific configuration of the sensor for a specific use case. New profiles might be included based on market demand.

The following Profiles are included in X4M300:

- Presence Profile

Additional profiles may be added in future firmware upgrades.
3 Sensor Operation

3.1 Power-up

3.1.1 Configuration

Profiles and User Settings can be loaded as described in the Module Connector documentation found on www.xethru.com.

User Settings vary between different profiles and each profile has its own default settings. See the Profile description chapters for details.

User Settings can only be changed when the profile is not running. To change any setting, follow these steps:

1. Stop running profile (if any profile is running)
2. Load desired profile (if not already loaded)
3. Send settings commands
   a. User Settings such as Detection Zone, Sensitivity etc.
   b. Output Control settings that determines what messages will be sent over the serial communication link on X4M300
4. Start running profile

Switching profiles will load the default User Settings for the new profile, regardless if this new profile has been run with different User Settings earlier.

3.1.2 Running Sensor Directly from Power-up or Reset

At power-up or reset, the sensor will start with its last used settings.

3.2 IO-pins

Various profiles may have different uses of IO-pins. Do not connect IO-pins that are not in use. The sensor module will pull up these IO-pins internally. Future FW upgrades of the sensor and any existing or future pin compatible products may use these unused IO-pins for other functionality.

3.3 Firmware Versions

The datasheet may describe features not yet implemented in the current firmware version of the module. The datasheet chapter Firmware Versions explains what features are implemented in which firmware versions.

3.4 Bootloader

The module has a bootloader to allow field firmware upgrades. The bootloader is locked and cannot be reprogrammed, thus it can never be erased, altered or removed from the module over the serial protocol. The bootloader can be entered through the serial protocol, and it is also possible to force the module into bootloader mode using the pin header interface. See datasheet chapter Interface Options for details.
Bootloader flowchart

If a firmware upgrade fails (e.g. power loss) the host providing the firmware upgrade must reinitiate the entire firmware upgrade process. The previous version of the firmware may be lost, but the bootloader will still operate as described even after a failed firmware upgrade attempt.

If the Flash on the microcontroller is erased using an external programmer or debugger, the unit cannot be reprogrammed to default functionality by the user.

3.5 Fail Safe Mode

To contain possible issues that could unintentionally block communication and new firmware upgrades of X4M300 a Fail Safe Mode is implemented.

X4M300 will count the number of resets caused by issues in the firmware and enter Fail Safe Mode after ten such consecutive resets. In Fail Safe Mode, the LED of X4M300 will be white. In Fail Safe Mode, X4M300 will only respond to commands from the XEP interface, and a module reset or firmware upgrade command can be issued. A reset command or power toggle will make X4M300 resume normal operation.
4 XeThru Presence Profile

4.1 Overview

The XeThru Presence Profile detects human presence in a defined detection zone. The X4M300 must be still during use and can be installed in the ceiling, on the wall, or in a product that stands still on a table, bookshelf or similar.

4.2 User Settings

4.2.1 Set Detection Zone

The upper limit of the Detection Zone sets the maximum distance for presence detection, while the lower limit sets the minimum distance.

<table>
<thead>
<tr>
<th>Detection Zone parameter limits</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum lower range</td>
</tr>
<tr>
<td>Maximum upper range</td>
</tr>
<tr>
<td>Minimum size of detection zone</td>
</tr>
<tr>
<td>Maximum size of detection zone</td>
</tr>
<tr>
<td></td>
</tr>
<tr>
<td>0.40m</td>
</tr>
<tr>
<td>9.40m</td>
</tr>
<tr>
<td>0.20m</td>
</tr>
<tr>
<td>9.00m</td>
</tr>
</tbody>
</table>

Step size between possible range settings is 5.14 cm. The desired detection zone can be set with 1 cm resolution. The actual detection zone will be set at the closest value before/after the input lower/upper range. The actual lower and upper range used by the sensor can be read back after setting the detection zone.

Movements closer to the sensor than the Detection Zone may trigger detection because of indirect reflection paths. Movements beyond the end of the detection zone will never trigger detection.

4.2.2 Sensitivity

<table>
<thead>
<tr>
<th>Sensitivity settings</th>
</tr>
</thead>
<tbody>
<tr>
<td>Minimum sensitivity</td>
</tr>
<tr>
<td>Maximum sensitivity</td>
</tr>
<tr>
<td>Sensitivity step size</td>
</tr>
<tr>
<td>0</td>
</tr>
<tr>
<td>9</td>
</tr>
<tr>
<td>1</td>
</tr>
</tbody>
</table>

Higher sensitivity setting gives better sensing of small targets. Lower sensitivity makes the sensor more robust against false detections.

4.2.3 LED

The module has 1 multi color RGB LED. The module LED can be configured between “Full” state indication, a “Simple” indication or “Off”.
**Full**

Initializing: Green (0.2 sec) -> Orange (0.2 sec) -> Red (0.3 sec) -> Orange (0.2 sec) -> Green (0.2 sec) -> Off (0.3 sec)
Presence: Orange (0.5 sec) -> Green (0.5 sec)
No Presence: Red (0.3 sec) -> Off (4.7 sec)
No profile running: Blue (0.2 sec) -> Off (4.7 sec)

**Simple**

Initializing: Green
Presence: Orange
No Presence: Red (0.3 sec) -> Off (4.7 sec)
No profile running: Blue (0.2 sec) -> Off (4.7 sec)

**Off**

Always: Off

**4.2.4 Frequency Band**

**Low**

In the low frequency band, X4M300 will operate in the 6.0 - 8.5 GHz band.

**High**

In the high frequency band, X4M300 will operate in the 7.25 - 10.20 GHz band.

**4.2.5 IO-pin Control**

**On**

When IO-pin control is On, IO-pins will operate as described in the IO-pin functionality table below.

**Off**

When IO-pin control is Off, IO-pins will be inputs with internal pull-up and have no function.

**4.2.6 Enable Noise Map**

**One**

Enables noise map.

**Off**

Disables noise map. Detailed description of noise map in Firmware Algorithms section below.

**4.2.7 Adaptive Noise Map**

**On**

Enables Noise Map adaptation. Noise Map will still not adapt in certain conditions as described in Firmware Algorithms section below.
Off

Disables Noise Map adaptation.

### 4.2.8 Initialize Noise Map at Reset

#### On

A new Noise Map will always be created at reset or when the profile is started. Sensor will be in Initialization state during Noise Map creation. A previously Stored Noise Map in the sensor will be ignored, but not overwritten, when the profile starts.

#### Off

If a valid Stored Noise Map exists this will be used at reset or when the profile is started. If no valid Stored Noise Map exists a new Noise Map will be created during Initialization state. The newly created Noise Map will be stored in the sensor when Initialization is done. A noise map created with a different Detection Zone is not valid.

### 4.2.9 Default User Settings

Default User Settings are applicable when the Presence Profile is selected, but no User Settings are specified.

<table>
<thead>
<tr>
<th>User Setting</th>
<th>Default value</th>
</tr>
</thead>
<tbody>
<tr>

</tr>
</tbody>
</table>

### 4.3 Sensor Operation in Presence Profile

#### 4.3.1 Detect Presence

There are four states in the Presence Profile:

- **No Presence:** No presence detected
- **Presence:** Presence detected
- **Initializing:** The sensor initializes after the Presence Profile is executed
- **Error:** The sensor is in an error state and requires a Profile and User Settings to be loaded
4.3.2 Measure Presence Data

When running, the following data is reported:

- **State**

When in No Presence or Presence states, the following data is measured:

- **Distance to static target**: Distance in meters to major static target closest to the sensor
- **MovementSlow**: Movements for the previous 20 seconds
- **MovementFast**: Movements for the previous 1 seconds

The movement metrics (MovementSlow and MovementFast) show the degree of movement as a relative number from 0 to 100 both for 5.14 cm intervals in the Detection Zone and for the entire Detection Zone. 0 means no Doppler cells above the detection threshold, while 100 means that all Doppler cells in the range interval are above the detection threshold.

When in Presence state, the following additional data is measured:

- **Distance to closest moving target**: Distance in meters to moving target closest to the sensor
- **Direction of closest moving target**: Direction (Toward, Away or Still) of moving target closest to the sensor

Moving target means any non-still target, including a stationary person with only respiration movement, who will be reported as a moving target with No direction.

All data is updated and available over serial communication interface once per second.

4.3.3 IO-pin Functionality

<table>

4.4 Detection Range

Detection range defines at what range and angle as seen from the sensor a person can be detected. The detection range varies with the size of the target person, the movement type of the target person and the angle between the sensor and the target person.
Detection range should not be confused with the user setting Detection Zone. Detection Zone defines at what range X4M300 is doing measurements. Detection range describes what can be detected inside the Detection Zone.

</tr>
</tbody>
</table>
Respiration Motion distance in meters shown as azimuth plot at 0° elevation

Respiration Motion distance in meters shown as elevation plot at 0° azimuth

Respiration Motion is defined as a standard person’s respiration movement as seen from the side or back of the person.

Minor Motion is defined in NEMA WD 7 - 2011 as a standard person waving his arm at 90°/s. Standard arm size is 3in x 3in x 15in (7.6cm x 7.6cm x 38.6cm).

Major Motion is defined in NEMA WD 7 - 2011 as a standard person walking at a speed of 4 +/- 0.5 ft/s (1.22 +/- 0.3 m/s).

A standard person is defined as having a radar cross section of 0.001 m², that equals 5ft 7in +/- 4in (1.70 +/- 0.10 m) and 170 +/- 20 lbs (77 +/- 9 kg). Standard person height and weight is defined in NEMA WD 7 - 2011.

Detection range at additional azimuth and elevation angles will be available as an application note on www.xethru.com.

4.5 Detection Time

Typical detection time for this profile is:
From No Presence to Presence state: 1.5 - 3 seconds
From Presence to No Presence state: 50 seconds

4.6 Firmware Algorithms

**Presence Profile signal processing block diagram**

All firmware algorithms for presence detection are running in the X4M300. The X4 UWB radar SoC is set up to provide 17 baseband data frames per second. The radar data frames are stored in a buffer. Two Range-Doppler matrices are running in parallel. The Slow Range-Doppler matrix is using the last 20 seconds of radar frames and the Fast Range-Doppler matrix is using the last 1 second of radar frames.

Both Range-Doppler matrices have individual Noise Maps to determine if a reflection at a certain distance and frequency is above a threshold. Creating and enabling a Noise Map will give different threshold values at different distances and frequencies and is recommended to achieve the best performance. If the Noise Maps are disabled a fixed threshold value will be used for all distances and frequencies, which in most cases will result in less sensitivity to small movements and higher risk of false detections.

The Noise Maps will adapt to changes in the environment unless Noise Map Adaptation is disabled. Noise Map adaptation works continuously and will over time remove presence detection of reflectors that are stationary. The Noise Map will not adapt if a still person with breathing frequency between 10 and 30 Respirations Per Minute (RPM) is detected.

The Fast Range-Doppler matrix with its Fast Movement Detector will detect presence quickly, typically when a person enters the Detection Zone. The Fast Movement Detector has two states, Movement or No Movement. The Fast M/N Combiner uses these states to determine the LocalStateFast. An M/N Combiner determines that M out of N detections need to be a certain value for the output to change.

**Logic for Fast M/N Combiner**

<table>
<thead>
<tr>
<th>LocalStateFast</th>
<th>M/N</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Movement -&gt; Movement</td>
<td>2/2</td>
</tr>
<tr>
<td>Movement -&gt; No Movement</td>
<td>49/50</td>
</tr>
</tbody>
</table>
The Slow Range-Doppler matrix with its Slow Movement Detector will detect presence of stationary people. Typically when a person is in the Detection Zone with no other movements than his respiration movement. The Slow Movement Detector has three states, Breathing, Movement and No Movement. The Slow M/N Combiner uses these states to determine the LocalStateSlow. An M/N Combiner determines that M out of N detections need to be a certain value for the output to change.

### Logic for Slow M/N Combiner

<table>
<thead>
<tr>
<th>LocalStateSlow</th>
<th>M/N</th>
</tr>
</thead>
<tbody>
<tr>
<td>No Movement -&gt; Movement</td>
<td>20/50</td>
</tr>
<tr>
<td>No Movement -&gt; Breathing</td>
<td>20/50</td>
</tr>
<tr>
<td>Movement -&gt; No Movement</td>
<td>31/50</td>
</tr>
<tr>
<td>Movement -&gt; Breathing</td>
<td>7/7</td>
</tr>
<tr>
<td>Breathing -&gt; No Movement</td>
<td>31/50</td>
</tr>
<tr>
<td>Breathing -&gt; Movement</td>
<td>4/4</td>
</tr>
</tbody>
</table>

The State Machine determines the (global) State, which is No Presence when both LocalStateFast and LocalStateSlow is No Movement and Presence in all other local state combinations.

### 4.6.1 Stored Noise Map

The Noise Map in use can be stored locally in the sensor. If a Stored Noise Map exists and User Setting Initialize Noise Map at Reset is off, the Stored Noise Map will be used.

If no valid Stored Noise Map exists, and User Setting Initialize Noise Map at Reset is off, a new Noise Map will be created during Initialization. This new Noise Map will also be stored locally in the sensor as the new Stored Noise Map.

The active Noise Map can become different than the Stored Noise Map due to Noise Map adaptation. The Stored Noise Map can be loaded as the active Noise Map during operation of the sensor without stopping the profile or disrupting operation of the sensor.

The Stored Noise Map can be deleted without disrupting operation of the sensor. To initialize a new Noise Map, delete the Stored Noise Map, and then stop and start the profile with User Setting Initialize Noise Map at Reset off. A new Noise Map will then be created during Initialization.

Only one Noise Map can be stored in the sensor.

The Stored Noise Map can be read and stored by the host and a new Stored Noise Map can be loaded over the serial interface.

### 4.6.2 Start-up Time

The Range-Doppler matrices are filled with radar data during Initialization state. This takes 20 seconds for the Slow Range-Doppler matrix. Creating a Noise Map takes 100 seconds. Total start-up time is 120 seconds when Noise Map is created and 20 seconds if a valid Stored Noise Map exists and User Setting Initialize Noise Map at Reset is off.
4.7 Baseband Data Output

Baseband data is generated approximately 17 times per second and shows reflection at all distances in the Radar Frames used in 5.14 cm intervals.

The length and position of Radar Frames is controlled by the actual lower and upper range determined by the Detection Zone User Setting. The Radar Frame starts 5.14 cm before the actual lower range and ends 5.14 cm after the actual upper range.

Baseband data is available as an option on the communication port.

Baseband data outputs either amplitude and phase information of reflections, or the same data represented with I and Q values.

A Frame Counter is supplied with the Baseband Data. The Frame Counter increases by 1 for each radar frame that is output from the X4 UWB radar SoC. Stopping and starting a profile does not reset the frame counter. Size of frame counter is $2^{32}$. The frame counter wraps to 0 when it reaches the maximum. With 17 frames per second, the max value is reached in approximately 8 years. A reset of the X4 UWB radar SoC or a power toggle of the sensor module will reset the frame counter.

Example of baseband data output

The example above shows the amplitude of reflections plotted for a 2 meter Radar Frame. This particular measurement shows two reflections; the first reflection is about 0.1 meter into the Radar Frame, and the second reflection is about 1.2 meter into the Radar Frame.

Refer to application notes on www.xethru.com for more detailed descriptions on how to use baseband data output.

4.8 Pulse-Doppler Processing and Range-Doppler Data Output

X4M300 uses Pulse-Doppler processing as described in more detail here: https://en.wikipedia.org/wiki/Pulse-Doppler_signal_processing.

Pulse-Doppler processing results in Range-Doppler data, which can be output from X4M300. The data is represented as Range-Doppler matrices that show all reflections at different distances and frequencies over the last time period as specified in the Firmware Algorithm section for each Profile. All reflections with Doppler frequency 0 (static reflectors) are removed before the Pulse-Doppler processing.
5 Certification Mode

5.1 Overview

X4M300 can be set in Certification Mode to test compliance with regulations.

5.2 Certification Modes

<table>
<thead>
<tr>
<th>Certification Mode</th>
<th>Jumper Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Tx Only</td>
<td><img src="image1" alt="Jumper Setting" /></td>
<td>Enables continuous UWB transmission, with all other activities disabled. Meaning that only the digital circuitry needed for operating the UWB transmitter, and the UWB transmitter is enabled. This mode is used to demonstrate the isolated emissions from the UWB transmitter, and the emissions generated by the digital circuitry needed to enable UWB transmission. The UWB transmitter must be set to continuous worst case transmission, i.e. that a pulse is sent at every PRI interval for the given chip setting, to maximize the average energy emitted from the module. LED is off in this mode to minimize noise.</td>
</tr>
<tr>
<td>Tx Only Digital</td>
<td><img src="image2" alt="Jumper Setting" /></td>
<td>Enables only the digital part used for continuous UWB transmitting, with all other activities disabled. The exact same settings as Tx only mode is used, but with the UWB transmitter disabled. This mode demonstrates radiated emissions from digital circuitry used to enable operation of the UWB transmitter. These emissions should comply with FCC 15.521, §15.209. LED is off in this mode to minimize noise.</td>
</tr>
<tr>
<td>Stream Tx Off</td>
<td><img src="image3" alt="Jumper Setting" /></td>
<td>Disables continuous UWB transmitting, while associated digital devices used to control additional functions or capabilities on module is operating. This mode is used to demonstrate emissions from unintentional radiators not needed for, or generated by, UWB transmission. LED is orange in this mode.</td>
</tr>
<tr>
<td>Stream</td>
<td><img src="image4" alt="Jumper Setting" /></td>
<td>Normal operation of the module with both UWB transmitter and associated digital devices, used to control additional functions or capabilities on module, activated. This mode is used to demonstrate typical emissions from a module during normal operation. LED is orange in this mode.</td>
</tr>
</tbody>
</table>
### Certification Mode

<table>
<thead>
<tr>
<th>Jumper Setting</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>2 1 15 16</td>
<td>In normal operation, the FW monitors the sampler outputs to ensure acknowledgement of reception. If no such acknowledgement is received, the EUT will shut down the transmitter within 10 seconds. During certification test, this situation can be provoked / emulated by forcing the receiver to not provide an acknowledgement of reception. The procedure is as follows: 1. Power off the device. 2. Set the EUT in Stream mode by the appropriate jumpers (11/12 and 15/16). 3. Power up the device by connecting the USB cable. The EUT should now emulate normal operation. 4. Set RX Fail emulation jumper (13/14), this will emulate a missing acknowledgement within 3 seconds. 5. TX should now be shut down by the standard FW. Alternatively, all three jumpers may be set in step 2 and then power up and omit step 4. The EUT will start transmitting and within maximum 10 seconds shut down. LED is orange in this mode.</td>
</tr>
<tr>
<td>2 1 15 16</td>
<td>Setting this jumper setting while the device is powered will return the module to normal operation after the execution of a power cycle. The module will then respond to the normal API over USB. Note that the EUT may be brought back to any other test mode by the appropriate jumper setting. LED is orange in this mode.</td>
</tr>
</tbody>
</table>

### 6 Firmware Versions

The firmware version can be read over the serial interface. All firmware versions support upgrading to a different firmware version.

In addition to the firmware versions described in this section, additional firmware versions with potential error corrections and stability improvements should be expected.

#### 6.1 X4M300 Version 1.0.7

First firmware version of X4M300 released to customers.

The following functions are supported:

- Presence / No Presence state
- Baseband data
- Distance to closest target
- MovementFast and MovementSlow data
- Noise Map is always initiated when the Presence profile is started
• Noise Map always adapts
• Only the low frequency band can be used

HW rev.6 and above cannot use this firmware version.

6.2 X4M300 Version 1.1.4

Features are same as for previous firmware version.

Improvements:

• Slow Pulse-Doppler matrix changed from 15 to 20 seconds, which improves sensitivity to detect people that are still.
• Movement Slow data shows movements for the previous 20 seconds. Previous FW version showed movements for the previous 15 seconds.
• Improved breathing detection, which leads to less adaption of noise map, which improves sensitivity to detect people that are still.
• Support for 2MB MCU (from X4M02 HW rev.6).
• Stability improvement. Previous FW version could reset unexpectedly.
• Changed enter bootloader command key to avoid unintentional downgrades of X4M02 with 2 MB MCU to FW version 1.0.7.
• Acknowledge stop command even when no profile is loaded.

6.3 X4M300 Version 1.2.1

All functions from previous firmware version with exception of noise map that will not initiate at reset if this is not selected in User Settings.

Added features from previous version:

• Initialize Noise Map at Reset
• Store Noise Map to sensor
• Delete Stored Noise Map in sensor
• Pulse-Doppler data output

6.4 X4M300 Version 1.3.1

Features are same as for previous firmware version.

See errata section for bug fixes

6.5 X4M300 Version 1.x

These additional functions are supported:

• Direction of closest target
• Enable / disable Noise Map
• Enable / disable Noise Map adaption
• Load a Stored Noise Map into active Noise Map in sensor
• Load and Store Noise Map to host
• Distance to first major static target
• GPIO functions
• USRT communication mode
6.6 X4M300 Version 2.x

Some of these features may be introduced as a new Profile not yet documented in this datasheet.

- Detection list for all moving targets in detection zone
- Radar Cross Section for all moving targets in detection zone
- Selection between low and high frequency band
- Faster response time from No Presence to Presence state

7 X4M300 HW Revisions

X4M300 uses the X4M02 hardware. This section describes all HW revisions of X4M02 that has been used in production, the difference between them and how to identify what HW revision your X4M300 is.

Some FW versions may require a specific HW revision. If applicable, this will be described in the FW version section of this datasheet.

7.1 Identifying HW revision

How to identify HW revision of X4M02

7.2 X4M02 rev.4

Initial HW revision used for production of X4M300.
7.3 X4M02 rev.5

- Added WiFi filter on Tx antenna.

Functionality is identical with previous HW revisions.

7.4 X4M02 rev.6

Initial HW revision used for production of X4M200.

- MCU change from 1MB to 2MB version.

Functionality is identical with previous HW revisions.

7.5 X4M02 rev.10

This HW revisions is required to meet the requirements for FCC and ETSI regulation.

- Added metal shield box on X4 UWB radar SoC.
- Replaced 12 MHz crystal with 12 MHz oscillator.
- Added components for EMI suppression.
- Added additional decoupling for MCU and SDRAM.
- Added filter on VDDPLLUSB domain.
- Improved MCU power delivery routing.
- Increased thickness of inner copper layers from 17 to 35 µm.

Functionality is identical with previous HW revisions.

8 Software Resources

8.1 XeThru Explorer

The XeThru Explorer application is a visual presentation of the protocol and data output from the sensor. It also allows for storing the measured data into a log file.

Firmware upgrades of X4M300 are deployed with new versions of XeThru Explorer.

XeThru Explorer can be downloaded from www.xethru.com.

8.2 XeThru Module Connector

The XeThru Module Connector is a software used to communicate with all XeThru radar sensor modules from a host computer through a serial interface. XeThru Module Connector makes a complete API of the modules available in host environments such as MATLAB, Python, C++ and C. This makes it easy to start streaming and analyzing radar data on multiple levels (raw radar data, baseband data, pulse doppler data, detection lists, respiration and presence) and directly to an environment ideally suited for development of new algorithms.

XeThru Module Connector includes a SW API that implements the serial protocol of X4M300.

XeThru Module Connector can be downloaded from www.xethru.com.
8.3 Module Communication Protocol Wrapper (MCP Wrapper)

Module Communication Protocol (MCP) is the lowest level communication protocol implementation for the XeThru modules, used on the module FW and XeThru host components, e.g. Module Connector. The MCP Wrapper goes one step further for embedded host implementation adding a wrapper with convenience methods around the MCP. Compared to Module Connector, which is a more feature rich component with logging and buffering capabilities, MCP Wrapper offers a similar interface with only the basic transport methods wrapped in a more easy-to-use interface.

Typical use for the MCP Wrapper is when implementing a host application communicating with a XeThru module on an embedded target that does not need or have the Module Connector available.

MCP Wrapper is implemented in C. Example code is available in C and C++.

MCP Wrapper can be downloaded from www.xethru.com.

8.4 X4M300 Firmware Binary

Firmware upgrades of X4M300 can be done by using Module Connector, MCP Wrapper or any other custom implementation of the serial protocol in a scenario where the modules are deployed. In this case, the module firmware file that is used during firmware upgrade is needed.

X4M300 firmware binary can be downloaded from www.xethru.com.

The connector is a 2x8 2.00mm pitch male pin header.

### 11.2 USB Connector

The X4M300 is fitted with a USB micro type B connector type supporting USB 2.0 High Speed.

### 11.3 Communication Modes

The sensor module will always use USB communication if USB power is present.

Additional communication modes can be selected at power-up or reset. The procedure is as follows seen from the host system outside the sensor:

1. Assert nRESET (set low for at least 1ms)
2. Set communication mode according to table below on pin 5 and 6.
3. Release nRESET (set high)
4. Hold communication mode level for at least 10 ms.
5. Set IO configuration of pins 3, 4, 5 and 6 to comply with the selected communication mode.
6. Selected communication is now activated on the sensor module

When USB is used this takes precedence over the table below. The use of USB is detected by the presence of power at the USB 5V power wire at startup. To change communication mode X4M300 need to be reset.

| UART      | High/Open (*)    | High/Open (*)    | Default UART settings are 115200 baud rate, 8 data bits, 1 stop bit, no parity
|           |                  |                  | This is the default mode. Enabled when pin 5 and pin 6 are left open. |

(*) MODESEL1 and MODESEL2 has pull-up resistors and can be left open if a “High” is required.

Not supported modes should not be selected. Future firmware versions may use these modes.

### 11.4 Power System

There are 2 possible ways to power the sensor: Through pins 1 and 2 on the 16-pin interface connector or via USB. Both power sources may be connected at the same time. When powering via the USB connector this will always take precedence over the 16-pin connector.
12 Schematics and Bill of Material

Schematics and Bill of Material for X4M300 is available from www.xethru.com.

13 Module User Guide

13.1 Placing the Sensor Module

The sensor module should be protected from environmental surroundings such as moisture. Most firmware algorithms assumes the sensor to be still with no movement or vibrations during operation.

When placing the sensor, pay attention to the following:

- Point the sensor in the direction of the object or zone to monitor
- Be aware of indirect reflections. An object 1 meter away may also give additional reflections via the floor, the ceiling or walls at longer distances
- Nearby metallic objects should be avoided, especially in the signal path to the sensor’s observation area
- The sensor can be placed on static (non-moving) surfaces such as:
  - On a desk
  - On a wall
  - Behind a wall (*)
  - In the ceiling
  - Behind the ceiling (*)

Firmware algorithms in the sensor module are sensitive to vibrations. If vibrations occur, the sensor may report movement in an empty detection zone.

If a sensor casing is required, the material should be of a kind that does not attenuate the high frequency signals in the sensor’s main direction. Recommended materials are ABS and other types of non-conductive plastics (*).

(*): Different materials will attenuate the signal. Application note regarding this topic is found at www.xethru.com.

13.2 Connecting the X4M300 to a host system

The X4M300 can be connected to a host system in several ways:

1. Via USB
2. Via the interface connector using the UART interface
3. Via the interface connector using the USRT interface. X4M300 will be a USRT slave.

Some Profiles have GPIO interface that can be enabled and operate as the only control interface for a sensor module. The GPIO interface is described in the Profile chapters of this datasheet.

13.2.1 Interfacing via USB

When interfacing via USB this interface will take presence over other interfaces.
13.2.2 Interfacing via UART

Simplified schematics of host MCU using UART mode

13.2.3 Interfacing via USRT

The USRT mode is using a clock line in addition to RX and TX lines.
13.3 Upgrading the Firmware Using the Bootloader

The module’s firmware may be update over USB or the serial port. XeThru Explorer can be used to update the module firmware.

LED will be purple during firmware upgrades.

14 Regulatory Approval

X4M300 is designed to meet UWB RF specifications of ETSI (Europe), FCC (USA), IC (Canada) KCC (Korea) and MIC (Japan).

This datasheet may describe several variants of X4M300 with different ordering codes. Not all ordering codes will meet all regulatory specifications.

Some regulatory specifications also specify how the sensor is used. Users of X4M300 must check regulatory requirements for their own use case and determine whether the regulatory approvals obtained from Novelda are sufficient for their product.

14.1 CE / ETSI Approval

English:
Hereby, Novelda AS declares that the radio equipment type X4M300 is in compliance with Directive 2014/53/EU. The full text of the EU declaration of conformity is available below.

Nederlands: Hierbij verklaar ik, Novelda AS, dat het type radioapparaat X4M300 conform is met Richtlijn 2014/53/EU. De volledige tekst van de EU-conformiteitsverklaring is hieronder beschikbaar.

Français: Le soussigné, Novelda AS, déclare que l’équipement radioélectrique du type X4M300 est conforme à la directive 2014/53/UE. Le texte intégral de la déclaration de conformité de l’UE est disponible ci-dessous.

Italiano: Il fabbricante, Novelda AS, dichiara che il tipo di apparecchiatura radio X4M300 e conforme alla direttiva 2014/53/UE. Il testo integrale della dichiarazione di conformità dell’UE è disponibile sotto.

Espanol: Por la presente, Novelda AS declara que el tipo de equipo radioeléctrico X4M300 es conforme con la Directiva 2014/53/UE. El texto completo de la declaración de conformidad de la UE está disponible a continuación.

Portugues: O(a) abaixo assinado(a) Novelda AS declara que o presente tipo de equipamento de radio X4M300 está em conformidade com a Diretiva 2014/53/UE. O texto completo da declaração de conformidade da UE está disponível abaixo.

Čeština: Timto Novelda AS prohlašuje, že typ radiového zařízení X4M300 je v souladu se směrnicí 2014/53 /EU. Úplné znění prohlášení o shodě EU je k dispozici níže.

Eesti: Kaasolevaga deklareerib Novelda AS, et kaesolev raadioseadme tuup X4M300 vastab direktiivi 2014/53/EL nouetele. ELi vastavusdeklaratsiooni täielik tekst on allpool.

Latviešu valoda:
Ar šo Novelda AS deklarē, ka radioiekārta X4M300 atbilst Direktīvai 2014/53/ES. ES atbilstības deklarācijas pilns teksts ir pieejams zemāk.

Malti:

Slovenčina:
Novelda AS týmto vyhlasuje, že rádiové zariadenie typu X4M300 je v súlade so smernicou 2014/53/EÚ. Úplné znenie vyhlášenia o zhode EÚ je k dispozícii nižšie.

Slovenščina:
Novelda AS potrjuje, da je tip radijske opreme X4M300 skladen z Direktivo 2014/53/EU. Celotno besedilo izjave EU o skladnosti je na voljo spodaj.

Romană:
Prin prezenta, Novelda AS declară că tipul de echipamente radio X4M300 este in conformitate cu Directiva 2014/53/UE. Textul integral al declarației UE de conformitate este disponibil mai jos.

български:
С настоящото Novelda AS декларира, че този тип радиосъоръжение X4M300 е в съответствие с Директива 2014/53/ЕС. Пълният текст на декларацията за съответствие на ЕС е на разположение по-долу.

Polski:
Novelda AS niniejszym oświadcza, że typ urządzenia radiowego X4M300 jest zgodny z dyrektywą 2014/53/UE. Pełny tekst deklaracji zgodności UE jest dostępny poniżej.

Norsk:
Novelda AS erklærer herved at radioutstyr type X4M300 er i samsvar med direktiv 2014/53/EU. Den fullstendige tekst i EU-samsvarserklæringen er tilgjengelig nedenfor.

Íslenska:
Hér með Novelda AS lýsir yfir að tegund þráðlausan búnað X4M300 er í samræmi við tilskipun 2014/53/ESB. Fullkominn texti ESB samræmisýfirlýsing er að finna hér að neðan.

Hrvatski:
Novelda AS ovime izjavljuje da je radijska oprema tipa X4M300 u skladu s Direktivom 2014/53/EU. Cijeli tekst izjave o sukladnosti EU-a nalazi se u nastavku.

Turk:
Burada, Novelda AS radyo ekipmanı türünün X4M300 2014/53/EU direktiflerine uyumlu oldugunu beyan eder. AB uyumu beyanının tam metni aşağıda verilmektedir.
14.1.1 EU Declaration of Conformity

EU DECLARATION OF CONFORMITY

1. Xethru X4M300 (product name)
2. Novelda AS, Garverivagen 2, NO-3850 Kviteseid, Norway (manufacturer, address)
3. This declaration of conformity is issued under the sole responsibility of the manufacturer
4. X4M300 Radar Sensor, HW version: 000164-010 (object of the declaration)
5. The object of the declaration described above is in conformity with the relevant Community harmonisation:
   European Directive 2014/30/EU (RED) and European Directive 2011/65/EU
6. The conformity with the essential requirements of the 2014/30/EU has been demonstrated against the following standards:

<table>
<thead>
<tr>
<th>Standard reference</th>
<th>Article of Directive 2014/30/EU</th>
</tr>
</thead>
<tbody>
<tr>
<td>EN 62479:2010</td>
<td>3.1 (a): Health and Safety of the User</td>
</tr>
<tr>
<td>EN 60865-1:2008</td>
<td>3.1 (b): Electromagnetic Compatibility</td>
</tr>
<tr>
<td>EN 301 469-1 (V2.1.1)</td>
<td>3.2 : Effective use of spectrum allocated</td>
</tr>
<tr>
<td>EN 301 469-33 (V2.1.1)</td>
<td></td>
</tr>
</tbody>
</table>

In addition the requirements in Directive (2011/65/EU) on the restriction of use of certain hazardous substances in electrical and electronic equipment is satisfied by application of EN 50581:2012

Thus, is placed on the product

7. The Technical Documention (TD) relevant to the product described above and which supports this Declaration of Conformity, is held at: Novelda AS, Garverivagen 2, NO-3850 Kviteseid, Norway

Signed for and on behalf of Novelda AS

Kviteseid, 20.09.2017

Dag Arne Brand, COO

X4M300 EU Declaration of Conformity
14.2 FCC Approval

FCC approval of X4M300 is pending.

The X4M300 module meets FCC Part 15 requirements for UWB transmission equipment intended for unlicensed indoor use or outdoor use when not permanently installed as specified in FCC Part 15.519, 15.521 and 15.209.

FCC ID: 2AD9QX4M02 (FCC Approval listing pending).

14.2.1 X4M300 Block Diagram

Module clock and power system

Clocks:

The systems clocks are derived from a 12 MHz crystal oscillator connected to the main microcontroller, and a 27 MHz oscillator connected to the Novelda X4 UWB impulse radar chip. The communication between the microcontroller and the X4 radar chip uses SPI protocol. The SPI communication clock is set up to run at 50 MHz.
Mean output power of X4M300 depends on the Pulse Repetition Frequency (PRF) and tx_power settings in the X4 radar chip. PRF is set to 15.875 MHz and tx_power is set to Medium (2) in X4M300. Both the PRF and tx_power can be changed by the microcontroller but cannot be changed to comply with FCC regulations. For further description of the radar chip, please refer to the X4 datasheet.

**Power:**

The module is powered externally from either the USB port or an external power supply. If both power sources are connected, the USB takes precedence over the external power.

**Antennas:**

The antennas are embedded onto the PCB and cannot be changed by users. Please refer to the Antenna chapter in the X4M02 datasheet for details on the antennas.

### 14.2.2 Radar Functional Description

The module uses the Novelda X4 impulse radar chip. Please refer to the X4 datasheet for a detailed description.

### 14.2.3 FCC Regulatory Notices

**Modification Statement**

Novelda AS has not approved any changes or modifications to this device by the user. Any changes or modifications could void the user’s authority to operate the equipment.

**Interference Statement**

This device complies with Part 15 of the FCC Rules. Operation is subject to the following two conditions: (1) this device may not cause interference, and (2) this device must accept any interference, including interference that may cause undesired operation of the device.

**RF Exposure Safety**

This equipment complies with FCC radiation exposure limits set forth for an uncontrolled environment. This transmitter must not be co-located or operating in conjunction with any other antenna or transmitter.

The X4M02 is a radio transmitter and receiver.

It is designed not to exceed the emission limits for exposure to radio frequency (RF) energy set by the Federal Communications Commission.

**FCC Class B Digital Device Notice**

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures:
• Reorient or relocate the receiving antenna.
• Increase the separation between the equipment and receiver.
• Connect the equipment into an outlet on a circuit different from that to which the receiver is connected.
• Consult the dealer or an experienced radio/TV technician for help.

Labelling Requirements for the Host Device

The host device shall be properly labelled to identify the modules within the host device. The certification label of the module shall be clearly visible at all times when installed in the host device, otherwise the host device must be labelled to display the FCC ID of the module, preceded by the words "Contains transmitter module", or the word "Contains", or similar wording expressing the same meaning, as follows:

Contains FCC ID: 2AD9QX4M02

UWB devices may not be employed for the operation of toys. Operation on-board an aircraft, a ship or a satellite is prohibited.

14.3 Industry Canada Approval

X4M300 is approved by Industry Canada (IC)

IC Certification Number: 22782-X4M02

14.3.1 Regulatory Information Canada

Changes or modifications not expressly approved by the party responsible for compliance could void the user's authority to operate the equipment.

Les changements ou modifications non expressément approuvés par la partie responsable de la conformité pourraient annuler l'autorisation de l'utilisateur d'utiliser l'équipement.

This device complies with Industry Canada's licence-exempt RSSs. Operation is subject to the following two conditions: (1) This device may not cause interference; and (2) This device must accept any interference, including interference that may cause undesired operation of the device.

Le présent appareil est conforme aux CNR d'Industrie Canada applicables aux appareils radio exempts de licence. L'exploitation est autorisée aux deux conditions suivantes : (1) l'appareil ne doit pas produire de brouillage, et (2) l'utilisateur de l'appareil doit accepter tout brouillage radioélectrique subi, même si le brouillage est susceptible d'en compromettre le fonctionnement.

14.3.2 RF exposure safety

The X4M02 is a radio transmitter and receiver.

It is designed not to exceed the emission limits for exposure to radio frequency (RF) energy set by the ISED.

Le X4M02 est un émetteur et un récepteur radio.

Il est conçu pour ne pas dépasser les limites d'émission pour l'exposition à l'énergie radiofréquence (RF) établie par l'ISDE.
14.3.3 Labelling Requirements for the Host Device

The host device shall be properly labelled to identify the modules within the host device. The certification label of the module shall be clearly visible at all times when installed in the host device, otherwise the host device must be labelled to display the IC of the module, preceded by the words "Contains transmitter module", or the word "Contains", or similar wording expressing the same meaning, as follows:

Contains IC: 22782-X4M02

14.4 KCC Approval

This chapter will cover the KCC approval of the X4M300.

14.5 MIC Approval

This chapter covers the MIC approval of the X4M300, which is for Japan: Ministry of internal affairs and communication (MIC)

15 Errata

15.1 Errata in Firmware Version 1.0.7

- X4M300 can unexpectedly reset. Workaround: Upgrade to FW ver.1.1.4 or newer.
- Memory leak in firmware may cause X4M300 to enter Fail Safe Mode. Workaround: Upgrade to FW ver.1.3.1 or newer. Workaround for this FW version: Toggle power or send a module reset command.
- Any reset, including intentional reset commands from a host, will cause the reset counter to increase. Fail Safe Mode may trigger after first reset caused by issues in the firmware if nine or more reset from any source has been experienced since last power-up. Workaround: Leave Fail Safe Mode by toggling power or send a module reset command.

15.2 Errata in Firmware Version 1.1.4

- Memory leak in firmware may cause X4M300 to enter Fail Safe Mode. Workaround: Upgrade to FW ver.1.3.1 or newer. Workaround for this FW version: Toggle power or send a module reset command.
• Any reset, including intentional reset commands from a host, will cause the reset counter to increase. Fail Safe Mode may trigger after first reset caused by issues in the firmware if nine or more reset from any source has been experienced since last power-up. Workaround: Leave Fail Safe Mode by toggling power or send a module reset command.

15.3 Errata in Firmware Version 1.2.1

• Memory leak in firmware may cause X4M300 to enter Fail Safe Mode. Workaround: Upgrade to FW ver.1.3.1 or newer. Workaround for this FW version: Toggle power or send a module reset command.
• Any reset, including intentional reset commands from a host, will cause the reset counter to increase. Fail Safe Mode may trigger after first reset caused by issues in the firmware if nine or more reset from any source has been experienced since last power-up. Workaround: Leave Fail Safe Mode by toggling power or send a module reset command.

15.4 Errata in Firmware Version 1.3.1

• Any reset, including intentional reset commands from a host, will cause the reset counter to increase. Fail Safe Mode may trigger after first reset caused by issues in the firmware if nine or more reset from any source has been experienced since last power-up. Workaround: Leave Fail Safe Mode by toggling power or send a module reset command.

15.5 Errata in X4M02 rev.6 and lower

USB communication can be unstable. The issue is more frequently observed with Win7, and less observed with Win10, Raspberry Pi, MacOs and Unix.

16 Support and Resources

Development support, resources, links to development partners and resellers can be found on Novelda’s web site www.xethru.com.
